#### Section 8

### CAPITAL AND PRODUCTION COST ESTIMATES

### INTRODUCTION

Estimates of plant investment and other capital requirements, as well as estimates of the costs of production of the coal liquid products, have been developed for the three coal conversion plants presented in Sections 5, 6, and 7. For reference, the basic parameters of these plants are summarized in Table 8-1. Data developed include:

- 1. Capital cost estimates
- 2. Required product selling prices to achieve acceptable returns on equity
- 3. Analysis of the sensitivity of product selling price to several factors including:
  - --Capital cost
  - --Technical and economic parameters
  - --Alternative financing schemes

Production cost estimates are developed on two bases: first, for nonregulated producers, and second, for regulated utility producers.

<sup>&</sup>lt;sup>a</sup> Thermal efficiency is shown for primary fuel products. By-products and power are excluded.

# PROJECT CAPITAL AND OPERATING COST ESTIMATING BASES

Table 8-2 presents the parameters used in developing the investment and production cost estimates. This table is divided into several sections as follows:

- A. General project parameters as applied to nonregulated producers
- B. Modifications to those general project parameters relevant to regulated producers
- C. Capital estimating bases
- D. Operating cost estimating bases

Tables 8-3, 8-4, and 8-5 present process contingency and maintenance cost rates for the three plants under consideration.

In an effort to quantify the uncertainty in the design and cost of a commercial-scale plant, process contingencies are added to those sections of the plant not considered to be commercially proven at this time. In addition, project contingency is applied at the rate of 15 percent of plant cost including process contingency to allow for additional equipment or other costs that would result from complete design of a specific project at an actual site.

Assumptions and considerations involved in developing the cost estimates are listed below:

- Location Springfield, Illinois area for Cases HE and CM
   Gillette, Wyoming area for Case HW
- All field labor data are based on a Stone & Webster labor survey for the plant locations mentioned above.
- Labor productivity is 1.31 for Springfield, Illinois area and 1.25 for Gillette, Wyoming area, based on ample labor being available at the job site. No construction camp cost is included.
- All material, subcontracts, labor, and construction costs are mid-1982.
- A clear and level site is assumed.
- A soil pressure of 3000 lb/sq ft and a frost line of 4 ft are assumed.
- It is assumed that no underground obstructions exist and that site drainage is not required.
- Electrical power is generated at the site with an emergency tie-in to the local power grid.
- Water supply is provided from a river water source including all associated water treating.
- All equipment costs are derived from Stone & Webster in-house estimating data, except for special proprietary items.
- Bulk materials and labor costs are estimated for foundations, electrical services, painting, fireproofing, and structural steel.

- Erection man-hours for equipment are based on Stone & Webster standard estimating labor units. Factored piping, instrumentation, and insulation man-hours are based on man-hour per dollar of material cost.
- All other indirect construction costs are factored based on inhouse historical data.
- The following items are excluded: office equipment, office supplies, medical equipment, and expendable laboratory supplies.

#### CAPITAL COST ESTIMATES

Table 8-6 summarizes capital requirements for the three cases under study. The data presented are based on data developed in subsequent tables and sections as follows:

- Tables 8-7, 8-8, and 8-9 present data on the catalyst and chemical requirements - both for initial fill and for makeup.
- Tables 8-10, 8-11, and 8-12 present the capital cost estimates for the plants by sections, with definition of the elements of these estimates: equipment and material, subcontract, labor, etc.
- The total capital requirements for a facility to start up in 1990 are based on data presented in Appendix A. These data were developed through use of an EPRI computer program designed to develop project costs on a real time basis as well as to develop manufacturing costs.

### PLANT OPERATING COSTS

Estimates of the fixed and variable operating costs for the three cases under study are presented in Tables 8-13, 8-14, and 8-15. These data are based on:

- The plant parameters presented in Table 8-1
- The operating cost bases presented in Table 8-2

and other elements of this study as stated in the tables.

Table 8-13
ESTIMATED PLANT OPERATING COSTS - CASE HE 100% ANNUAL CAPACITY FACTOR PLANT OUTPUT: 14.175 x 10<sup>9</sup> BTU/HR

| Fixed Costs                          | Basis   | Unit Cost          | Cost 1982<br>_\$10 <sup>3</sup> /Yr | \$/10 <sup>6</sup> Btu<br>Output |

#### PRODUCTION COSTS

Using the investment and operating requirement data developed in earlier parts of this section, required selling prices have been developed for the fuel products produced in the three cases under study. Required selling price for a nonregulated producer, in mid-1982 dollars, is defined as the price which, if escalated at the general inflation rate, together with coal and other operating costs, will yield the producer a stipulated minimum acceptable rate of return of common equity. As noted in Table 8-2, the inflation rate is assumed to be 8.5 percent per year and the after tax rate of return on common equity is 18.3 percent per year. This rate of return is equivalent to 9.0 percent per year in the absence of inflation (1.09 x 1.085 = 1.183).

For a regulated producer, the year-by-year price is determined which would provide the specified return on investment. Also, for comparison purposes, a levelized price is calculated in mid-1982 dollars, which is financially equivalent.

These required selling prices, as well as development of the capital outlay schedules, have been developed using the EPRI E&EE computer program. This program accomplishes several objectives including accounting for the annual requirements for funds during construction, the annual rates of capital recovery (both debt and equity), the annual revenue requirements, and the levelized required selling price. A more complete discussion of the program outputs and examples of these outputs for the cases under study are presented in the Appendix.

Tables 8-16 and 8-17 present the results of this computer analysis for the non-regulated and the utility cases, respectively. Also included are the outputs of several computer runs made to assess the sensitivity of the required selling price to several important variables.
