Gorman Green C3 Aviation Gasoline

Report received from Shell, Cairo (Report S.298, Sample T.D.739) covering analysis by The Anglo-Egyptian Oilfields, Limited, Suez

Specific Gravity .....	0.772
Colour (By inspection) .....	Brilliant, fluorescent green
Distillation - I.B.P. ....	52°C
Recovery @ 75°C .....	9½
100°C .....	46½
150°C .....	89½
F.B.P. ....	171°C
Total Recovery .....	98½
Residue .....	1½
Loss .....	1½
Odour .....	Good
Freezing Point .....	Below -60°C
Existent Gum .....	Nil
Vapour Pressure (lb./sq.in.) ....	4.0
Corrosive Sulphur (mg./100 ml.)...	0.27
Lead Content (mls.T.E.L./I.G.) ...	5.6
Sulphur .....	0.01%
Bromine No. ....	2
Octane No. (C.F.R. M.M.) .....	99

Hydrocarbon Analysis

Aromatics .....	41%
Paraffins .....	41%
Naphthenes .....	17%
Unsaturates .....	1
Water Solubles .....	Nil

The high octane number of 99 reported by Suez was not confirmed by a test on a sample received in U.K. The latter sample gave a figure of 96 which is in line with the octane number of recent German green fuels.

The Secretary,  
Petroleum Board Enemy Fuels Committee.

Enemy Fuel - Sample No. AIR 331 (Sholl, Cairo Report S.298)

I give below spectroscopic analysis of this fuel made by examining the infra red and ultra violet spectra of the cuts of a distillation on the small I.C.I. still at the rate of 50 ml. per hour.

AROMATICS

The estimations were made on bulked cuts from a fast distillation in the small I.C.I. still (500 ml. distilled).

Benzene .....	6.8%
Toluene .....	11.3%
Xylenes (n/p = 4/1) ....	6.6%
Ethyl Benzene .....	4.5%
Hydrindenes .....	1.6%
<u>TOTAL</u> ....	<u>30.8%</u>

This total does not give the total aromatic in the fuel because the distillation was stopped at 150°C, and it was not possible to estimate the higher aromatics except the hydrindenes which are very strongly absorbing. In addition the residue showed an unidentified ultra violet absorption band.

OCTANES

An attempt was made with this fuel to estimate the individual octanes, although the cutting is not close enough to make the figures accurate. The values given for 22 DM Hexane, 223 and 233 TM Pentanes are certainly very inaccurate but those for 224 and 234 TM Pentanes and the total octane should be within 5-7% of the true values. Please note when comparing this analysis with previous ones that in the past 22 DM Hexane has been estimated with 224 TM Pentane, and 233 and 223 TM Pentanes with 234 TM Pentane.

224 TM Pentane .....	11.1%
22 DM Hexane .....	0.9%
223 TM Pentane .....	0.8%
234 TM Pentane .....	4.3%
233 TM Pentane .....	0.4%
<u>TOTAL</u> ....	<u>17.5%</u>

Yours faithfully,  
(Sd) A.R.Philpotts.

SECRETGerman Ammunition

A captured German document published on 21st June, 1943, gives the following information on some types of ammunition now available for use against Tanks and aircraft fuel tanks:

<u>Calibre</u>	<u>Type</u>	<u>Target</u>
15 mm.	Armour-piercing with Tungsten carbide core (either percussion or electrically detonated)	Medium Tanks
20 mm. Gurlikon	Incendiary Tracer. (Day and night trace available)	Aircraft fuel tanks
20 mm. MG 151	Incendiary Tracer. (Day and night trace available). (Either percussion or electrically detonated)	Aircraft fuel tanks
3.7 cm.	Armour-piercing tracer (with Tungsten carbide core)	Heavy and Very Heavy Tanks

It is interesting to note the reference to 3.7 cm. ammunition; although no German aircraft with a weapon of this calibre has yet been identified in service in Italy or Africa, reports have been received that the Ju 87, armed with a 3.7 cm. gun, has been in use on the Russian Front.

examination was completed on one sample only.  
It is probable that the samples were taken from  
different parts of the oil system of one engine  
or from different engines of this particular  
aircraft.

---

AIR 324 and AIR 325 are typical high-grade aero lubricants of the non-compounded 100 grade generally employed by the Germans. Both are of the low specific gravity, high V.I., low sulphur type, and are probably solvent extracted distillates blended with Bright Stock or solvent extracted long residuums.

AIR 326 is not a normal aero oil and is not typical of any product known to be in general use by the Germans. 60" oils are of course known to be used for special aviation purposes and AIR 326 may represent a special product for use at low temperature. Although the viscosity is so much lower, however, it is to be noted that the pour point is higher than that of AIR 324 and AIR 325. This oil, like the other two, is probably a blend of a solvent-treated distillate with a small proportion of Bright Stock.

## ENEMY OILS AND FUELS

### OILS

OILS - Nos. AIR 313, AIR 314, AIR 315, AIR 316;  
MAR.188, MECH.336, MECH.337, MECH.338, MECH.339, MECH.340;  
MECH.341, MECH.342, MECH.343, MECH.351, MECH.358.

The attached reports on 15 enemy lubricating oils represent samples of captured material presumably selected locally by the Mobile Petroleum Laboratory as likely to be of particular interest. The analyses are cross referred to the Analysis Bulletin serials of the No.1 Mobile Petroleum Laboratory, R.A.S.C.

The reports may be commented upon as follows:

AIR 313 and AIR 314 - These, from their viscosities, are not aero engine oils and are probably used for motor transport purposes. They are probably mainly distillates from indigenous German crude oil of the "Roitbrook" type.

AIR 315 - This is an aero oil of the "120 second" class and is of the Pennsylvania type containing appreciable quantities of Bright Stock. Its description as being "Clarenty Refined" is understood to refer to an arrangement made prior to the entry of Italy into the War in 1940 for the purchase from various American suppliers of aviation grade oils. "Clarenty" does not therefore refer to an individual refining company but to the purchasing agency.

AIR 316 - This is a mineral hydraulic oil somewhat similar in nature to previous oils of this description taken from the Italians.

MAR.188 is a marine steam cylinder oil possibly of asphaltic Rumanian crude oil origin. It has no special features.

MECH.336 - This is a blended M.T.oil of S.A.E.40 category. It contains some residual oil and may be a blend of such material with a solvent refined Rumanian distillate.

MECH.337 is a high-grade S.A.E.40 oil having a Viscosity Index of 100. It is solvent-refined and may be a blend of distillate and Bright Stock or derived from the treatment of a long residuum.

MECH.338 - This is similar in some respects to a solvent refined asphaltic Rumanian distillate, but its sulphur content and specific gravity are rather high for oil of this origin.

SECRET

- 2 -

5th September 1945

MOTOR OILS AND FUELS.

OILS - Nos. AIR 513, AIR 514, AIR 515, AIR 516;  
M.R.168, MECH.336, MECH.337, MECH.338, MECH.339, MECH.340;  
MECH.341, MECH.342, MECH.343, MECH.358.

MECH.339, MECH.340, MECH.341 and MECH.342 are all Ultradense in grade and the variation in viscosity between the oils (406 - 502 secs. Redwood 1 at 140°F) indicates the extent to which Italian oils of the same grade may vary in viscosity. The four oils are generally similar in physical properties and they may consist of "Reitbrook" oil. MECH.341 from its saponification value appears to contain a small amount of fatty matter.

MECH.343 - This is a high V.I. oil probably made up from solvent refined distillate and Bright Stock. From its saponification value this also appears to contain a small amount of fatty oil.

MECH.358 - The origin of this oil is not evident from the analysis.

MECH.351 - This is a high-grade high viscosity oil and resembles solvent refined German oils of the Hanover type. It is described as a Diesel Oil but would be heavy for motor transport work and may have been employed specially for heavier stationary engines.

Benzene .....	8.0%
Toluene .....	12.0%
Xylenes &c. .....	10.0%
Higher Aromatics .....	7.0%

Water Solubles .....	Nil
Phenols .....	0.02%

This fuel is similar to recent German Green fuels having very good rich mixture rating and higher octane number than the original green fuels.

Hydrocarbon Analysis

Aromatics .....

$32.0\%$

Paraffins .....

$62.0\%$

Naphthalenes .....

$6.0\%$

Water Solubles .....

Nil

This is not a typical German Green fuel. Although the lead content corresponds to that normally found in German Aviation fuels, the Octane Number is low. The sample appears to be contaminated with a small proportion of kerosene.
